QUESTION 1

An invoke activity in a BPEL process is dehydrated _____. (select two)

- A. immediately after execution if idempotent is set to True
- B. before execution if idempotent is set to True
- C. immediately after execution if idempotent is set to False
- D. before execution if idempotent is set to False

Correct Answer: CD

QUESTION 2

Which capability or benefit is not applicable to Oracle Service Bus?

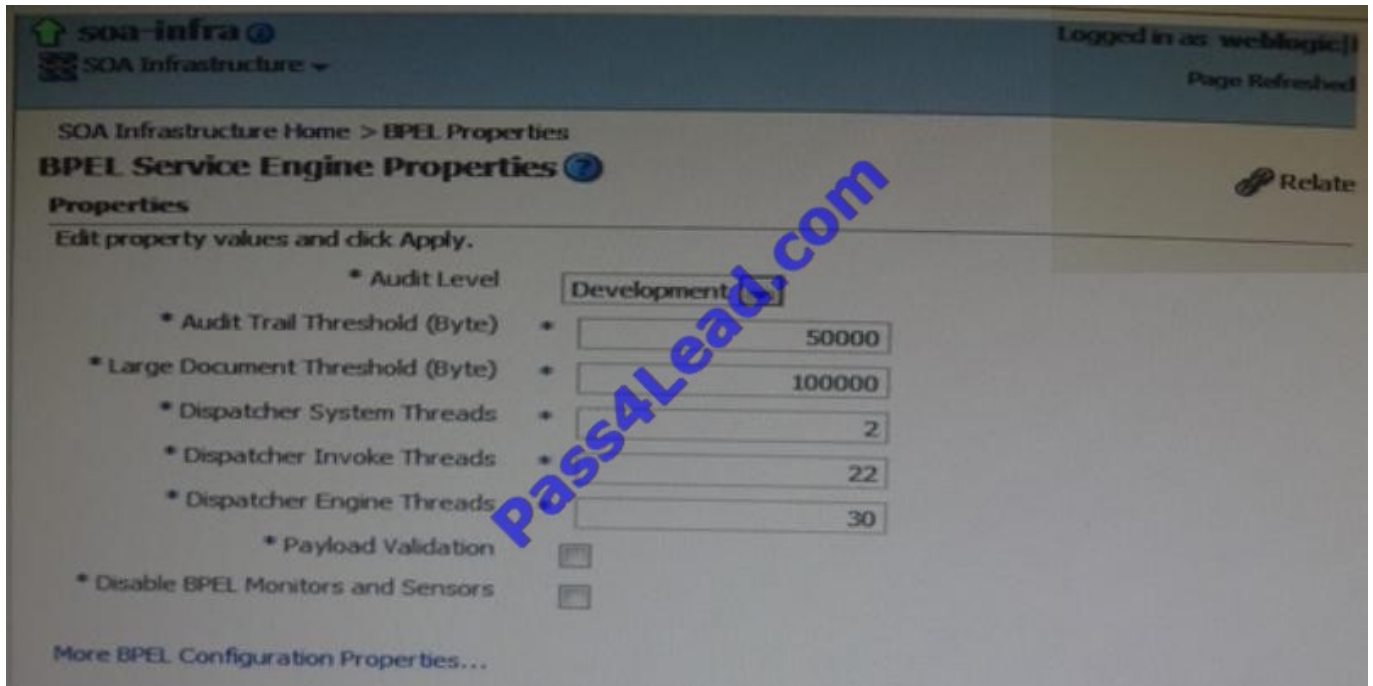

- A. Service mediation
- B. Service abstraction
- C. Translation and transformation
- D. Service creation
- E. Stateful processing

Correct Answer: E

Service Bus only can do stateless processing, and one of the most important benefits of Service Bus is the service abstraction

QUESTION 3

View the Exhibit.

The Exhibit shows a display from Enterprise manager Fusion Middleware Control where you can monitor and manage BPEL service engine properties. Where are all changes to this configuration stored?

- A. bpel_config.xml in MDS
- B. soa-infra-config.xml in \$MW_HOME/soa/config on each physical host in cluster
- C. soa-infra-config.xml in the soa-infra-wls.ear file
- D. a temporary directory on each physical host in the cluster

Correct Answer: B

* The main controls of Oracle SOA Service Infrastructure can be configured using the soa-infra- config.xml file located in the DOMAIN_HOME/ config/soa-infra/configuration directory. In this file you can specify:

- / The data source JNDI name for process dehydration.
- / The server and callback URL
- / The audit level of information to be collected by the message tracking infrastructure.

Note:

*

In Oracle BPEL Process Manager 11g, you specify Oracle BPEL Process Manager engine properties in bpel-config.xml and soa-infra-config.xml (both are accessible as MBeans).

*

You can change the SOA Infrastructure ServerURL property port from Oracle Enterprise Manager Fusion Middleware Control Console. This automatically updates the port setting in the soa-infra-config.xml file under \$DOMAIN_HOME/

config/Domain_Name/configuration.

*

Since 11.1.1.2, bpel-config.xml is no longer available into the file system and therefore the only chance for modification is through EM Console.

*

bpel-config.xml Configurations for BPEL Engine.

Incorrect:

Not C: Oracle SOA Service Infrastructure Services are contained in the soa-infra-wls.ear file.

QUESTION 4

A partner needs to access services that are defined in one of your Service Composite Architecture (SCA) applications via a web service interface. Which approach (and accompanying reasoning) describes a loosely coupled and robust solution?

- A. Use Oracle Service Bus to provide an Interface layer over your SCA application. This enables you to hide the locations of your SCA application, perform load-balancing across those endpoints, and provide the ability to define service level agreements to help ensure that you are meeting your contractual obligations to the partner.
- B. Use the Mediator component to provide a web service interface to your SCA application. This arrives you the flexibility of using the industry standard XSLT technology to perform translation and transformations.
- C. Use Oracle Service Bus to provide an interface layer over your SCA application. This enables you to "skin" your SCA application with a web service interface and still provide a robust experience to the partner.
- D. Allow the partner simply to connect directly to the SCA application. This provides the best performance and helps keep the partner happy.

Correct Answer: A

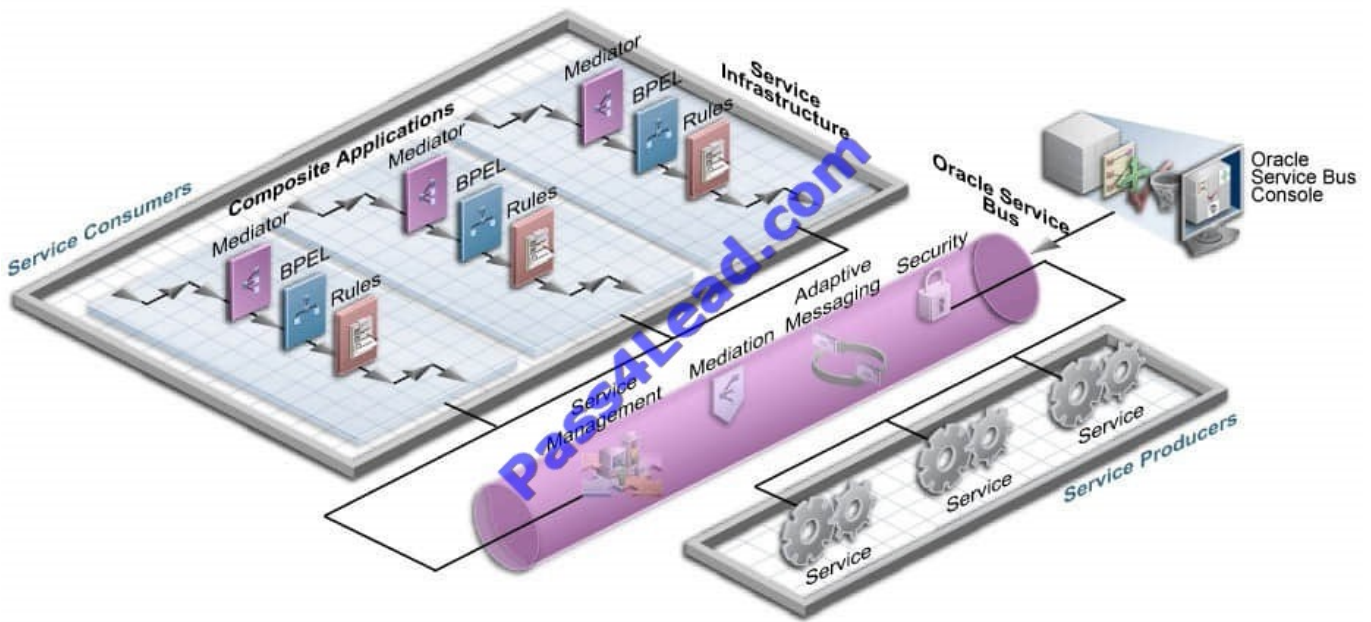

*

Oracle Service Bus supports the following capabilities for the transformation or processing of messages:

/ Transforms messages based on XQuery or XSLT etc: Validates incoming messages against schemas Selects a target service or services, based on the message content or message headers Transforms messages based on the target service Supports transformations on both XML and MFL messages Message enrichment Supports callouts to Web services to gather additional data for transformation (for example, country code, full customer records, and so on)

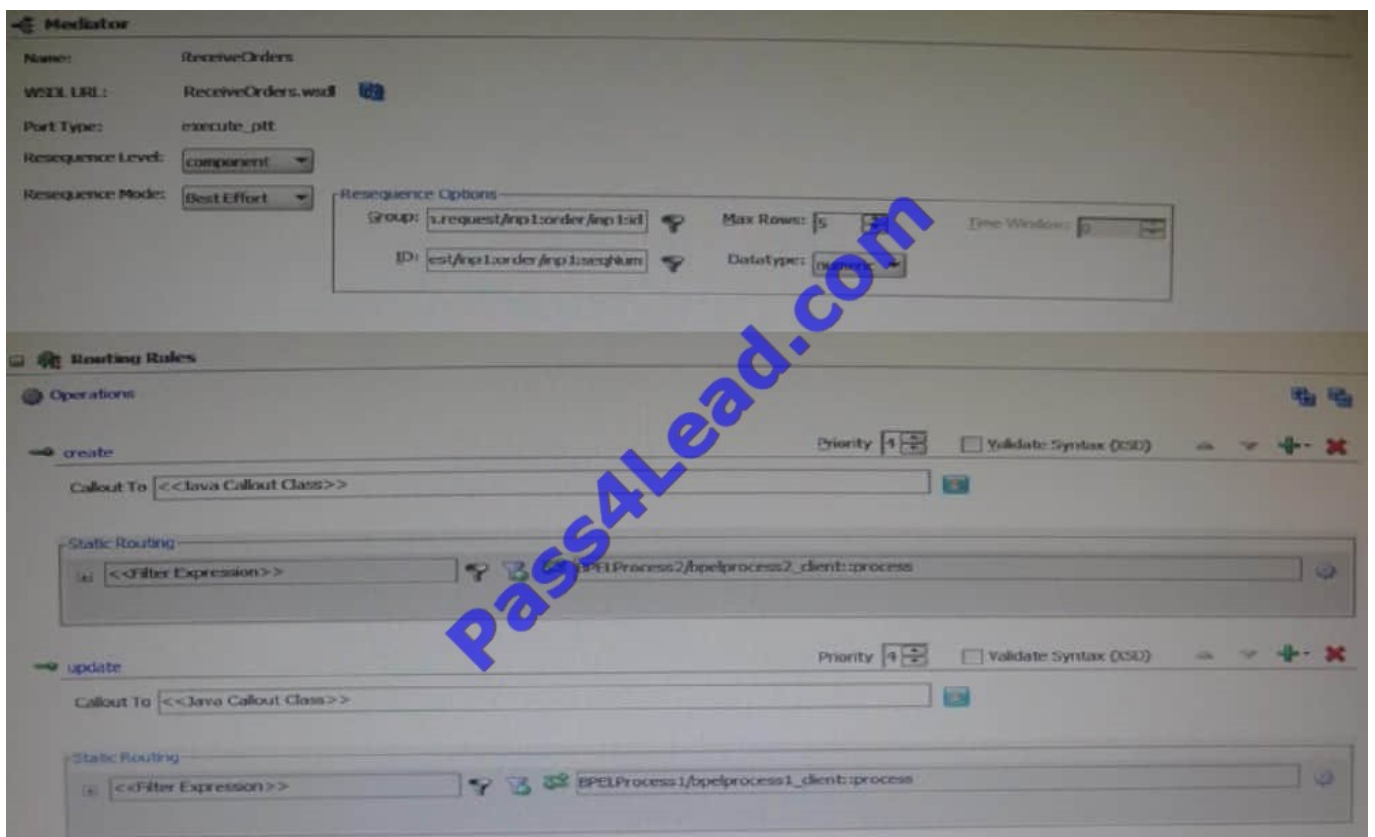

*

Oracle Service Bus Intermediary

QUESTION 5

View the Exhibit.

A user has configured Mediator M1 to receive and route product Information from System X into its internal applications in chronological order. For each product1 M1 receives one create number of "update" events from an AQ Queue via a JMS adapter. M1 can receive updates to the product at any time of day. The user claims that incoming messages for

each product are received and processed in the correct chronological order 95% of the time. However, the messages are being processed out of order 5% of the time. This results in critical errors in the target systems. The user expects all messages pertaining to a product to be unconditionally processed in the order of arrival at M1.

What causes this discrepancy?

- A. The user is running on a four node SOA cluster and has not configured the inbound JMS adapter to be a singleton.
- B. The user is running a single-node SOA environment but has configured the number of inbound adapter threads to be a value greater than 1.
- C. The given Mediator configuration does not address this sequencing requirement.
- D. The user has configured resequencer worker threads to a value greater than 1 for the Mediator service engine.

Correct Answer: C

*

From the exhibit we see: Resequence Level: component Resequence Mode: Best Effort

*

It is important to note that the messages to outbound services of the Oracle Mediator service component configured for best effort resequencing are not guaranteed to arrive in order of a sequence ID. At any given time, a snapshot of the available messages is taken and sequencing is performed only on those messages. Therefore, unlike a standard resequencer, it is not guaranteed that a message with a lesser sequence ID value is sent before a message that has a greater sequence ID value but that arrived earlier. Messages with a lesser sequence ID value that arrive later might be processed in the following cycle when a snapshot of available messages is taken again and the messages are reordered.
