QUESTION 1

By default, which two K values does EIGRP for IPv6 use to calculate the metric? (Choose two.)

A. reliability

B. bandwidth

C. load

D. MTU

E. delay

Correct Answer: BE

QUESTION 2

Which programming language do you use to script interactions between Cisco devices and network controllers such as APIC-EM?

A. POSIX

B. Python

C. Java

D. C++

Correct Answer: B

QUESTION 3

What is the best way to verify that a host has a path to other hosts in different networks?

A. Ping the loopback address.

B. Ping the default gateway.

C. Ping the local interface address.

D. Ping the remote network.

Correct Answer: D

Ping is a tool that helps to verify IP-level connectivity; PathPing is a tool that detects packet loss over multiple-hop trips. When troubleshooting, the ping command is used to send an ICMP Echo Request to a target host name or IP address.

Use Ping whenever you want to verify that a host computer can send IP packets to a destination host.

You can also use the Ping tool to isolate network hardware problems and incompatible configurations. If you call

ipconfig /all and receive a response, there is no need to ping the loopback address and your own IP address --Ipconfig has

already done so in order to generate the report.

It is best to verify that a route exists between the local computer and a network host by first using ping and the IP address of the network host to which you want to connect. The command syntax is:

ping

Perform the following steps when using Ping:

Ping the loopback address to verify that TCP/IP is installed and configured correctly on the local computer.

ping 127.0.0.1

If the loopback step fails, the IP stack is not responding. This might be because the TCP drivers are corrupted, the network adapter might not be working, or another service is interfering with IP. Ping the IP address of the local computer to

verify that it was added to the network correctly. Note that if the routing table is correct, this simply forwards the packet to the loopback address of 127.0.0.1.

ping

Ping the IP address of the default gateway to verify that the default gateway is functioning and that you can communicate with a local host on the local network.

ping

Ping the IP address of a remote host to verify that you can communicate through a router.

ping

Ping the host name of a remote host to verify that you can resolve a remote host name.

ping

Run a PathPing analysis to a remote host to verify that the routers on the way to the destination are operating correctly.

pathping

QUESTION 4

What is the default VLAN on an access port?

A. 0

B. 1

C. 10

D. 1024

Correct Answer: B

QUESTION 5

Which role is used by VLAN 1 by default?

A. to propagate VLAN information between switches

B. to pass management traffic

C. to initialize the STP protocol

D. to pass traffic designated for isolation from other traffic on the switch

Correct Answer: B
