-  **100% Money Back** Guarantee
-  **365 Days** Free Update
-  **800,000+** Satisfied Customers

QUESTION 1

Why are some virtual machines orphaned after rebooting a High Availability (HA) enabled host?

- A. The Orphaned virtual machines have HA restart disabled.
- B. The Orphaned virtual machines moved recently and the change did not persist.
- C. The host is attached to failed storage.
- D. The host just came out of maintenance mode.

Correct Answer: A

If the host is rebooted within an hour after the virtual machines are moved or powered on, the vmlInventory.xml file does not persist and hostd does not report these virtual machines as registered on the host. In an HA-enabled cluster, this condition impacts only the virtual machines with HA restart disabled. QUESTION 2

When is it possible to place a VMFS5 datastore in maintenance mode?

- A. When it is a member of a Storage DRS cluster
- B. When it is a member of Virtual SAN cluster
- C. When it is a member of a multi-extent datastore
- D. When it is a member of a Virtual Volume

Correct Answer: A

Storage DRS introduced the feature Datastore Maintenance mode and this new feature can be compared to Host Maintenance Mode. When a datastore is placed in Maintenance Mode all registered virtual machines on that datastore, are migrated to the other datastores in the datastore cluster. Datastore maintenance mode can be used to safely migrate virtual machines out of the datastore for storage array related maintenance operations such as migrating a LUN to another RAID group, however it is also an excellent feature that can help you during a storage migration project migrating virtual machines from standalone VMFS3 datastores to VMFS5 datastores aggregated in a Storage DRS datastore cluster.

QUESTION 3

What are two ways to identify TCP/IP stack information? (Choose two.)

- A. Using the vSphere Web Client

- B. Using esxcli network ip netstack
- C. Using esxcfg-netstack
- D. Using the vSphere Client

Correct Answer: AB

Use vSphere web client or the command esxcli network ip netstack to identify TCP/IP stack info. Reference: <https://virtualizationreview.com/articles/2015/10/26/configure-multiple-tcpip-stacks-in-vsphere6.aspx>

QUESTION 4

An administrator has just completed installing an ESXi 6.x host, but doesn't know what address has been configured.

Where is the ESXi host IP address configured?

- A. RVC console
- B. Direct Console User Interface
- C. vSphere Web Client D. vSphere Client

Correct Answer: B

Access Direct Console User Interface to configure ESXi host IP address.

Reference: <http://www.virtualizationadmin.com/articles-tutorials/vmware-esx-and-vsphere-articles/installation-and-deployment/understanding-vmware-esxi-direct-console-user-interface-dcui.html>

QUESTION 5

An administrator has unsuccessfully attempted several times to install an Operating System inside a virtual machine. The administrator finds that the installation fails at random intervals.

Which two actions can be taken to resolve this issue? (Choose two.)

- A. Verify the md5sum and if invalid, download the installation files again.
- B. Attempt the installation an additional time.
- C. Attempt to use a different installation media or installation method.
- D. Create a new virtual machine and attempt the installation with the existing media.

Correct Answer: AC

First verify md5sum and if it is invalid, download installation files again. Secondly, attempt to use a different installation media because the one used might be corrupt.
