QUESTION 1

A technician is tasked with moving a user from one redundant Session Manager pair to another. Which sequence describes the steps that should be taken?

- A. Go to the User's User Profile. Select different Session Manager instance from the Primary Session Manager and Secondary Session Manager lists.
- B. Go to the user's User Profile. De-select the current community. Select the new community.
- C. Navigate to the Communities page. Select the Community into which the user will be moved. Select the user from a drop down list to add the user to the community.
- D. Go to the Locations page. Select a location, define it as a Primary community and add the user. Select another location, define it as a Secondary community and add the user.

Correct Answer: A

QUESTION 2

Application definition allows system administrators to define and manage individual applications, each with their own attributes? The definitions allow administrators to add one or such applications to which of the following?

- A. application programs
- B. application data sets
- C. application sequences
- D. application lists

Correct Answer: C

QUESTION 3

System Manager provides a Dashboard summary for monitoring and validating the health of each Session Manager instance. What information is not available from the Session Manager Dashboard?

- A. Service State
- B. Security Module status
- C. Entity Monitoring
- D. Managed Bandwidth status

Correct Answer: D

QUESTION 4

What is validated when the Transport Layer Security (TLS) handshake and mutual TLS authentication is performed between the SIP entity and Session Manager?

- A. entity link
- B. entity name
- C. domain
- D. certificate

Correct Answer: D

QUESTION 5

Session Manager has a routing policy that routes calls made to any number beginning with \\100\\ to SIP Entity X. However, \\sip.-1001avaya.com\\ is the SIP communication profile address of user Y. User Y is not currently registered (signed in) with Session Manager. What will happen if Session Manager receives a call addressed to \\sip.-1001avaya.com\\ and why?

- A. It depends on the time ranges of the policy. If the call is placed inside a defined time range for the policy, the call will be routed to destination X. If not, then Session Manager will attempt to route the call to user Y. Since Y is not registered, the call will timeout, and the call will fail.
- B. Since user Y is not currently registered, the call will be handled by the routing policy. If the call is placed during a time range specified by the policy, then the call will be routed to destination X.
- X. If not, then the call will fail.
- C. Since the destination URI matches a communication profile SIP handle, Session Manager will not use the routing policy in handling the call. The call will fail since user Y is not currently registered.
- D. Since the destination URI matches a routing policy dial pattern, Session Manager will give no consideration to the user Y registration status. If the call is made during a time range for the policy, the policy will be applied and the call will be routed to destination X. If not, then the original URI of \\sip.-1001avaya.com\\ will be used as the destination to which Session Manager will route the call.

Correct Answer: C
