### QUESTION 1

You administer a Microsoft SQL Server 2012 database.

All database traffic to the SQL Server must be encrypted by using secure socket layer (SSL) certificates or the connection must be refused.

Network administrators have deployed server certificates to the Windows store of all Windows servers on the network from a trusted Certificate Authority. This is the only Certificate Authority allowed to distribute certificates on the network.

You enable the Force Encryption flag for the MSSQLServer protocols, but client computers are unable to connect. They receive the following error message:

"A connection was successfully established with the server, but then an error occurred during the pre-login handshake, (provider: SSL Provider, error: 0 - The certificate chain was issued by an authority that is not trusted.) (Microsoft SQL Server)" You notice the following entry in the SQL Server log:

"A self-generated certificate was successfully loaded for encryption."

You need to configure SQL Server to encrypt all client traffic across the network. You also need to ensure that client computers are able to connect to the server by using a trusted certificate.

Which three actions should you perform in sequence? (To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order,)

Select and Place:

Restart the SQL Server.

Leave the certificate blank in the drop-down list on the **Certificates** tab.

Choose the new root-level certificate from the drop-down list on the **Certificates** tab.

Install Certificate Services on the SQL Server, and create a new root-level certificate.

From the SQL Configuration Manager on the SQL Server, open the **Protocols** properties for the SQL instance.

Choose the server certificate provided by the network administrators from the drop-down list on the **Certificates** tab.

From the SQL Configuration Manager on every client computer that will be connecting to SQL Server, open the **Protocols** properties for the SQL instance.

Correct Answer:

The screenshot shows a vertical list of instructions for configuring certificates on a SQL Server. The instructions are as follows:

- Leave the certificate blank in the drop-down list on the **Certificates** tab.
- Choose the new root-level certificate from the drop-down list on the **Certificates** tab.
- Install Certificate Services on the SQL Server, and create a new root-level certificate.
- From the SQL Configuration Manager on every client computer that will be connecting to SQL Server, open the **Protocols** properties for the SQL instance.
- From the SQL Configuration Manager on the SQL Server, open the **Protocols** properties for the SQL instance.
- Choose the server certificate provided by the network administrators from the drop-down list on the **Certificates** tab.
- Restart the SQL Server.

## QUESTION 2

You are developing a SQL Server Integration Services (SSIS) package to load data into a Windows Azure SQL Database database. The package consists of several data flow tasks.

The package has the following auditing requirements:

If a data flow task fails, a Transact-SQL (T-SQL) script must be executed.

You need to ensure that auditing is configured to meet these requirements.

What should you do?

- A. Use an event handler for OnError for the package.
- B. Use an event handler for OnError for each data flow task.
- C. Use an event handler for OnTaskFailed for the package.
- D. View the job history for the SQL Server Agent job.
- E. View the All Messages subsection of the All Executions report for the package.
- F. Store the System::SourceID variable in the custom log table.
- G. Store the System::ServerExecutionID variable in the custom log table.
- H. Store the System::ExecutionInstanceGUID variable in the custom log table.
- I. Enable the SSIS log provider for SQL Server for OnError in the package control flow.
- J. Enable the SSIS log provider for SQL Server for OnTaskFailed in the package control flow.

- K. Deploy the project by using dtutil.exe with the /COPY DTS option.
- L. Deploy the project by using dtutil.exe with the /COPY SQL option.
- M. Deploy the .ispac file by using the Integration Services Deployment Wizard.
- N. Create a SQL Server Agent job to execute the SSISDB.catalog.validate\_project stored procedure.
- O. Create a SQL Server Agent job to execute the SSISDB.catalog.validate\_package stored procedure.
- P. Create a SQL Server Agent job to execute the SSISDB.catalog.create\_execution and SSISDB.catalog.start\_execution stored procedures.
- Q. Create a table to store error information. Create an error output on each data flow destination that writes OnError event text to the table.
- R. Create a table to store error information. Create an error output on each data flow destination that writes OnTaskFailed event text to the table.

Correct Answer: C

---

### QUESTION 3

You administer a Microsoft SQL Server 2012 database instance.

You plan to migrate the database to Windows Azure SQL Database. You verify that all objects contained in the database are compatible with Windows Azure SQL Database.

You need to ensure that database users and required server logins are migrated to Windows Azure SQL Database.

- A. Back up the database from the local server and restore it to Windows Azure SQL Database.
- B. Use the Copy Database wizard.
- C. Use the Database Transfer wizard.
- D. Use SQL Server Management Studio to deploy the database to Windows Azure SQL Database.

Correct Answer: D

---

### QUESTION 4

Note: This question is part of a series of questions that use the same set of answer choices. An answer choice may be correct for more than one question in the series.

You administer a Microsoft SQL Server 2012 server that hosts a transactional database and a reporting database. The transactional database is updated through a web application and is operational throughout the day. The reporting database is only updated from the transactional database.

Database	Description
Transactional database	Recovery model: <ul style="list-style-type: none"><li>• Full</li></ul> Backup schedule: <ul style="list-style-type: none"><li>• Full database backup: midnight, daily</li><li>• Differential database backup: on the hour, every two hours starting at 02:00 hours except at 00:00 hours</li><li>• Log backup: every half hour, except at the times of full and differential backups</li></ul>
Reporting database	Recovery model: <ul style="list-style-type: none"><li>• Simple</li></ul> Backup schedule: <ul style="list-style-type: none"><li>• Full database backup: 01:00 hours daily</li><li>• Differential database backup: 13:00 hours daily</li></ul> Data updates: <ul style="list-style-type: none"><li>• Changes in data are updated from the transactional database to the reporting database at 00:30 hours and at 12:30 hours</li><li>• The update takes 15 minutes</li></ul>

One of the hard disk drives that stores the transactional database fails at 23:32 hours. Attempts to create a tail log backup are unsuccessful. You need to ensure that the transactional database is restored. You also need to ensure that data loss is minimal,

What should you do?

- A. Perform a page restore.
- B. Perform a partial restore.
- C. Perform a point-in-time restore.
- D. Restore the latest full backup.
- E. Restore the latest full backup. Then, restore the latest differential backup.
- F. Restore the latest full backup, and restore the latest differential backup. Then, restore the latest log backup.
- G. Restore the latest full backup, and restore the latest differential backup. Then, restore each log backup taken before the time of failure from the most recent differential backup.
- H. Restore the latest full backup. Then, restore each differential backup taken before the time of failure from the most recent full backup.

Correct Answer: G

## QUESTION 5

You are developing a SQL Server Integration Services (SSIS) package.

The package control flow will contain many tasks. The tasks will execute consecutively and none will execute more than

once. Certain groups of tasks will share variable and transaction scope.

You need to group tasks together while enabling them to be collapsed and expanded as a group.

Which item should you use from the SSIS Toolbox? (To answer, select the appropriate item in the answer area.)
