### QUESTION 1

When the SteelHead SaaS optimization service is correctly configured, how does the SteelHead identify the SaaS traffic that needs to be optimized?

- A. The SteelHead recognized the URL of the SaaS traffic using the DPI engine.
- B. The SteelHead must be configured with appropriate in-path rules on the cloud SteelHead.
- C. The SteelHead must be configured with appropriate in-path rules on the data center side.
- D. As part of the configuration, the SteelHead downloads a list of IP addresses that correspond to SaaS servers.
- E. The SteelHead must be configured with appropriate in-path rules on the client side.

Correct Answer: E

You can configure what traffic a Steelhead appliance optimizes and what other actions it performs, using the following:

\* In-Path rules - In-path rules determine the action a Steelhead appliance takes when a connection is initiated, usually by a client.

\*Peering rules - Peering rules determine how a Steelhead appliance reacts when it detects a probe query.

In-path rules are used only when a connection is initiated. Because connections are typically initiated by clients, in-path rules are configured for the initiating, or client-side, Steelhead appliance.
