QUESTION 1

You are designing an ASP.NET Web API application.

You need to select an HTTP verb to allow blog administrators to remove a comment.

Which HTTP verb should you use?

- A. PUT
- B. DELETE
- C. POST
- D. GET

Correct Answer: B

QUESTION 2

You need to perform the initial deployment of the web application. You must ensure that the application meets the performance requirements. Which file should you modify before you deploy the application?

- A. the service definition file (.csdef)
- B. the application configuration file (app.config)
- C. the packages configuration file (packages.config)
- D. the Global.asax file (.asax)

Correct Answer: A

You use cscfg file to define various settings related to your cloud application (in ConfigurationSettings section). Like app.config file, you get to define other things (e.g.number of instances of your cloud application) in the cscfg file. You could

change the settings in a cscfg file on the fly using either the portal or Service Management API without having to repackage and redeploy the application.

Scenario: After the initial deployment, any changes to the business logic of the Web API must cause minimal downtime to the web application in the production environment.

QUESTION 3

You are developing an ASP.NET Core MVC web application. The application will use Entity Framework Core and a SQLite database.

You rename a property in the Customer data model. You attempt to apply the migration to the SQLite database and receive a NotSupportedException error that includes a table named Customer.

You need to resolve the migration error.

Which four actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Select and Place:

Actions	Answer Area
Create an index on the existing Customer table.	<div>←</div> <div>→</div> <div>↑</div> <div>↓</div>
Drop the index on the new Customer table.	
Drop the existing Customer table.	
Copy data from the existing Customer table to a new Customer table.	
Create a new Customer table.	
Rename the existing Customer table.	

Correct Answer:

Actions	Answer Area
Create an index on the existing Customer table.	Rename the existing Customer table.
Drop the index on the new Customer table.	Create a new Customer table.
	Copy data from the existing Customer table to a new Customer table.
	Drop the existing Customer table.

QUESTION 4

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one

correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You deploy an ASP.NET Core web application to Azure App Services. You are using Azure Event Hubs to collect the telemetry data for the application.

You need to configure Event Hubs to automatically deliver the telemetry data stream to a persistent data store.

Solution: Configure Event Hubs Capture to deliver data to Azure Data Lake Store.

Does the solution meet the goal?

A. Yes

B. No

Correct Answer: B

Use Azure Blob storage to store the telemetry data.

QUESTION 5

DRAG DROP

You are developing an Internet-based ASP.NET Web API application that manages pet data. You install an SSL certificate on the web server to encrypt calls to the API. You create a class named `PetAuthorization`, which inherits from a type

named `AuthorizeAttribute`, and implements the `OnAuthorization()` method.

You need to implement basic authentication for the API.

What should you do? To answer, drag the appropriate words to the correct targets in the answer area. Words may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Select and Place:

Words

Forms

None

Windows

Authorize

`PetAuthorization`

`SecurityPermission`

WWW-Authenticate

Authorization

Proxy-Authenticate

Allow

Answer Area

Set the authentication mode in the `web.config` file to

Word

then apply the

Word

attribute to the controller. Finally, add code to the `AuthorizeAttribute` to return a

Word

header in the case of a failed authentication.

Correct Answer:

Words

Forms

None

PetAuthorization

SecurityPermission

Authorization

Proxy-Authenticate

Allow

Answer Area

Set the authentication mode in the web.config file to

Windows

then apply the

Authorize

attribute to the controller. Finally, add code to the AuthorizeAttribute to return a

WWW-Authenticate

header in the case of a failed authentication.

Box 1: Windows

To enable Basic authentication using IIS, set the authentication mode to "Windows" in the Web.config of your ASP.NET project:

Box 2: Authorize

In your Web API project, add the [Authorize] attribute for any controller actions that need authentication.

Box 3: WWW-Authenticate

If the request was unauthorized, add the WWW-Authenticate header to the response.
