**QUESTION 1**

The Common Language Specification (CLS) standard:

- A. Defines a common development environment for writing applications.
- B. Allows code written in different languages to interact.
- C. Defines a common syntax for all programming languages.
- D. Allows code written for a desktop application to run as a web application.

Correct Answer: B

QUESTION 2

Which describes the effect of applying the protected accessibility modifier to a method?

- A. The method is available to all classes derived from the declaring class.
- B. The method is available only to other methods in the same class.
- C. The method cannot be overridden in child classes.
- D. The method is available only to classes in the same assembly.

Correct Answer: A

QUESTION 3

An event declaration is shown in the following code segment. `Public Event NewProduct As NewProductEventHandler`
What is `NewProductEventHandler` in the event declaration?

- A. An enumeration that defines the type of the `NewProduct` variable.
- B. A built-in data type for handling events.
- C. The name of the delegate that will dispatch the event.
- D. The name of the class method that will catch the event.

Correct Answer: C

QUESTION 4

Which application domain host manages security for web applications?

- A. Browser

- B. Custom-designed
- C. Server
- D. Shell

Correct Answer: A

QUESTION 5

Which two types of actions can trigger an event? (Each correct answer presents a complete solution. Choose two.)

- A. Declaring the signature of the delegate.
- B. Some other program logic, such as a call to the program module,
- C. Adding a delegate keyword.
- D. User intervention, such as a mouse click,

Correct Answer: AD

*

A delegate is a type that holds a reference to a method. A delegate is declared with a signature that shows the return type and parameters for the methods it references, and can hold references only to methods that match its signature.

*

Events in the .NET Framework are based on the delegate model. The delegate model follows the observer design pattern, which enables a subscriber to register with, and receive notifications from, a provider. An event sender pushes a notification that an event has happened, and an event receiver receives that notification and defines a response to it.
