QUESTION 1

You have an Azure subscription that contains two applications named App1 and App2.

App1 is a sales processing application.

When a transaction in App1 requires shipping, a message is added to an Azure Storage account queue, and then App2 listens to the queue (or relevant transactions).

In the future, additional applications will be added that will process some of the shipping requests based on the specific details of the transactions.

You need to recommend a replacement for the storage account queue to ensure that each additional application will be able to read the relevant transactions.

What should you recommend?

- A. one Azure Service Bus queue
- B. one Azure Service Bus topic
- C. one Azure Data Factory pipeline
- D. multiple storage account queues

Correct Answer: D

QUESTION 2

You have an Azure subscription that contains an Azure SQL database named DB1. Several queries that query the data in DB1 take a long time to execute. You need to recommend a solution to identify the queries that take the longest to execute.

What should you include in the recommendation?

- A. SQL Database Advisor
- B. Azure Monitor
- C. Performance Recommendations
- D. Query Performance Insight

Correct Answer: D

Query Performance Insight provides intelligent query analysis for single and pooled databases. It helps identify the top resource consuming and long-running queries in your workload. This helps you find the queries to optimize to improve overall workload performance and efficiently use the resource that you are paying for.

Reference: <https://docs.microsoft.com/en-us/azure/azure-sql/database/query-performance-insight-use>

QUESTION 3

You need to identify the maximum amount of data loss that can occur if a virtual machine fails over to another region.

What should you identify?

NOTE: To answer this question, sign in to the Azure portal and explore the Azure resource groups.

1.
data from the past 24 hours
2.
data from the past four hours
3.
data from the past eight hours
4.
data from the past two hours

Correct Answer:

Need to check which the oldest recovery point that you can use.

We can do this by checking the retention window of the replication policy.

<https://docs.microsoft.com/en-us/azure/site-recovery/azure-to-azure-common-questions>

QUESTION 4

HOTSPOT

Your company has the divisions shown in the following table.

Division	Azure subscription	Azure Active Directory (Azure AD) tenant
East	Sub1, Sub2	East.contoso.com
West	Sub3, Sub4	West.contoso.com

You plan to deploy a custom application to each subscription. The application will contain the following:

1.
A resource group
- 2.

An Azure web app

3.

Custom role assignments

4.

An Azure Cosmos DB account

You need to use Azure Blueprints to deploy the application to each subscription. What is the minimum number of objects required to deploy the application? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

Hot Area:

Management groups:

1
2
3
4

Blueprint definitions:

1
2
3
4

Blueprint assignments:

1
2
3
4

Correct Answer:

Management groups: ▼

1
2
3
4

Blueprint definitions: ▼

1
2
3
4

Blueprint assignments: ▼

1
2
3
4

Box 1: 2

One management group for East, and one for West.

When creating a blueprint definition, you'll define where the blueprint is saved. Blueprints can be saved to a management group or subscription that you have Contributor access to. If the location is a management group, the blueprint is

available to assign to any child subscription of that management group.

Box 2: 1

One definition as the you plan to deploy a custom application to each subscription. With Azure Blueprints, the relationship between the blueprint definition (what should be deployed) and the blueprint assignment (what was deployed) is

preserved.

Box 3: 4

One assignment for each subscription.

<https://docs.microsoft.com/en-us/azure/governance/blueprints/overview>

**QUESTION 5**

Note: This question is a part of series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while

others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

Your company has deployed several virtual machines (VMs) on-premises and to Azure. Azure ExpressRoute has been deployed and configured for on-premises to Azure connectivity.

Several VMs are exhibiting network connectivity issues.

You need to analyze the network traffic to determine whether packets are being allowed or denied to the VMs.

Solution: Use Azure Advisor to analyze the network traffic. Does the solution meet the goal?

A. Yes

B. No

Correct Answer: B

Instead use Azure Network Watcher to run IP flow verify to analyze the network traffic.

Note: Advisor is a personalized cloud consultant that helps you follow best practices to optimize your Azure deployments. It analyzes your resource configuration and usage telemetry and then recommends solutions that can help you improve

the cost effectiveness, performance, high availability, and security of your Azure resources.

With Advisor, you can:

Get proactive, actionable, and personalized best practices recommendations.

Improve the performance, security, and high availability of your resources, as you identify opportunities to reduce your overall Azure spend.

Get recommendations with proposed actions inline.
