QUESTION 1

HOTSPOT

You have an Azure Storage account that generates 200,000 new files daily. The file names have a format of {YYYY}/{MM}/{DD}/{HH}/{CustomerID}.csv.

You need to design an Azure Data Factory solution that will load new data from the storage account to an Azure Data Lake once hourly. The solution must minimize load times and costs.

How should you configure the solution? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Hot Area:

Answer Area

Load methodology:		▼
	Full Load	
	Incremental Load	
	Load individual files as they arrive	

Trigger:		▼
	Fixed schedule	
	New file	
	Tumbling window	

Correct Answer:

Answer Area

Load methodology:

	▼
Full Load	
Incremental Load	
Load individual files as they arrive	

Trigger:

	▼
Fixed schedule	
New file	
Tumbling window	

Box 1: Incremental load

Box 2: Tumbling window

Tumbling windows are a series of fixed-sized, non-overlapping and contiguous time intervals. The following diagram illustrates a stream with a series of events and how they are mapped into 10-second tumbling windows.

Tell me the count of tweets per time zone every 10 seconds

A 10-second Tumbling Window

Time (secs)

```
SELECT TimeZone, COUNT(*) AS Count
FROM TwitterStream TIMESTAMP BY CreatedAt
GROUP BY TimeZone, TumblingWindow(second,10)
```

QUESTION 2

You are designing a star schema for a dataset that contains records of online orders. Each record includes an order date, an order due date, and an order ship date. You need to ensure that the design provides the fastest query times of the records when querying for arbitrary date ranges and aggregating by fiscal calendar attributes. Which two actions should you perform? Each correct answer presents part of the solution. NOTE: Each correct selection is worth one point.

- A. Create a date dimension table that has a DateTime key.
- B. Use built-in SQL functions to extract date attributes.
- C. Create a date dimension table that has an integer key in the format of YYYYMMDD.
- D. In the fact table, use integer columns for the date fields.
- E. Use DateTime columns for the date fields.

Correct Answer: BD

QUESTION 3

You are designing a solution that will use tables in Delta Lake on Azure Databricks. You need to minimize how long it takes to perform the following:

1.

Queries against non-partitioned tables

2.

Joins on non-partitioned columns

Which two options should you include in the solution? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. the clone command
- B. Z-Ordering
- C. Apache Spark caching
- D. dynamic file pruning (DFP)

Correct Answer: BD

Best practices: Delta Lake

B: Provide data location hints If you expect a column to be commonly used in query predicates and if that column has high cardinality (that is, a large number of distinct values), then use Z-ORDER BY. Delta Lake automatically lays out the data in the files based on the column values and uses the layout information to skip irrelevant data while querying.

BD: Dynamic file pruning, can significantly improve the performance of many queries on Delta Lake tables. Dynamic file pruning is especially efficient for non-partitioned tables, or for joins on non-partitioned columns. The performance impact

of dynamic file pruning is often correlated to the clustering of data so consider using Z-Ordering to maximize the benefit.

Incorrect:

Not C: Spark caching

Databricks does not recommend that you use Spark caching for the following reasons:

You lose any data skipping that can come from additional filters added on top of the cached DataFrame.

The data that gets cached might not be updated if the table is accessed using a different identifier (for example, you do `spark.table(x).cache()` but then write to the table using `spark.write.save(/some/path)`).

<https://learn.microsoft.com/en-us/azure/databricks/optimizations/dynamic-file-pruning>

QUESTION 4

HOTSPOT

You have an Azure Synapse Analytics pipeline named Pipeline1 that contains a data flow activity named Dataflow1.

Pipeline1 retrieves files from an Azure Data Lake Storage Gen 2 account named storage1.

Dataflow1 uses the `AutoResolveIntegrationRuntime` integration runtime configured with a core count of 128. You need to optimize the number of cores used by Dataflow1 to accommodate the size of the files in storage1. What should you configure? To answer, select the appropriate options in the answer area.

Hot Area:

To Pipeline1, add:

A custom activity
A Get Metadata activity
An If Condition activity

For Dataflow1, set the core count by using:

Dynamic content
Parameters
User properties

Correct Answer:

To Pipeline1, add:

- A custom activity
- A Get Metadata activity
- An If Condition activity

For Dataflow1, set the core count by using:

- Dynamic content
- Parameters
- User properties

QUESTION 5

DRAG DROP

You need to create a partitioned table in an Azure Synapse Analytics dedicated SQL pool.

How should you complete the Transact-SQL statement? To answer, drag the appropriate values to the correct targets. Each value may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to

view content.

NOTE: Each correct selection is worth one point.

Select and Place:

Values

- CLUSTERED INDEX
- COLLATE
- DISTRIBUTION
- PARTITION
- PARTITION FUNCTION
- PARTITION SCHEME

Answer Area

```
CREATE TABLE table1
(
  ID INTEGER,
  col1 VARCHAR(10),
  col2 VARCHAR(10)
) WITH
(
  [ ] = HASH(ID),
  [ ] (ID RANGE LEFT FOR VALUES (1, 1000000, 2000000))
);
```

Correct Answer:

Values

- CLUSTERED INDEX
- COLLATE
- PARTITION FUNCTION
- PARTITION SCHEME

Answer Area

```
CREATE TABLE table1
(
  ID INTEGER,
  col1 VARCHAR(10),
  col2 VARCHAR(10)
) WITH
(
  DISTRIBUTION = HASH(ID),
  PARTITION (ID RANGE LEFT FOR VALUES (1, 1000000, 2000000))
);
```

Box 1: DISTRIBUTION

Table distribution options include DISTRIBUTION = HASH (distribution_column_name), assigns each row to one distribution by hashing the value stored in distribution_column_name.

Box 2: PARTITION

Table partition options. Syntax:

PARTITION (partition_column_name RANGE [LEFT | RIGHT] FOR VALUES ([boundary_value [,...n]]))
