#### **QUESTION 1**

You need to configure the RailStatusUpdater cloud flow. What should you do?

- A. Create a JavaScript function to update the run mode values of each action within the desktop flow.
- B. Create an environment variable. Update each desktop flow action to read the variable.
- C. Manually update each desktop flow action to change the run mode.
- D. Create a desktop flow to update the run mode values of each action within the cloud flow.

Correct Answer: B

According to the scenario, you want to run the desktop flow actions in unattended mode when the cloud flow is triggered by a schedule, and in attended mode when the cloud flow is triggered manually. To achieve this, you can create an environment variable that stores the run mode value (attended or unattended) and use it as an input for each desktop flow action. This way, you can change the run mode value dynamically without having to manually update each action.

#### **QUESTION 2**

You develop a desktop flow. The flow performs five actions in sequence.

If an error occurs, you must restart the flow from the first action. You add the five actions to an On block error action.

You need to configure error handling.

Which two actions should you perform? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Change the exception handling mode to Go to the beginning of the block.
- B. Select Continue flow run.
- C. Select Throw error.
- D. Change the exception handling mode to Go to next action.
- E. Configure an On error condition for the first action.

Correct Answer: AB

# **QUESTION 3**

### DRAG DROP

You create a solution within a Microsoft Power Platform environment. The environment includes all connections required for the solution.
