QUESTION 1

Report acceleration has been enabled for a specific use case. In which bucket location is the corresponding CSV file located?

- A. thawedPath
- B. summaryHomePath
- C. tstatsHomePath
- D. homePath, coldPath

Correct Answer: B

QUESTION 2

Which of the following is the most efficient search?

- A. `index=foo sourcetype=bar | lookup local=t mylookup host OUTPUT host_flag | where host_flag= "true" | stats count by host`
- B. `index=foo sourcetype=* | lookup mylookup host OUTPUT host_flag | where host_flag= "true" | stats count by host`
- C. `index=foo sourcetype=bar | fields host | lookup mylookup host OUTPUT host_flag | where host_flag= "true" | stats count by host`
- D. `index=foo sourcetype=bar | table host | lookup local=t mylookup host OUTPUT host_flag | where host_flag= "true" | stats count by host`

- A. Option A
- B. Option B
- C. Option C
- D. Option D

Correct Answer: C

QUESTION 3

A customer has asked for a five-node search head cluster (SHC), but does not have the storage budget to use a replication factor greater than 2. They would like to understand what might happen in terms of the users' ability to view historic scheduled search results if they log onto a search head which doesn't contain one of the 2 copies of a given

search artifact.

Which of the following statements best describes what would happen in this scenario?

- A. The search head that the user has logged onto will proxy the required artifact over to itself from a search head that currently holds a copy. A copy will also be replicated from that search head permanently, so it is available for future use.
- B. Because the dispatch folder containing the search results is not present on the search head, the user will not be able to view the search results.
- C. The user will not be able to see the results of the search until one of the search heads is restarted, forcing synchronization of all dispatched artifacts across all search heads.
- D. The user will not be able to see the results of the search until the Splunk administrator issues the apply shcluster-bundle command on the search head deployer, forcing synchronization of all dispatched artifacts across all search heads.

Correct Answer: A

QUESTION 4

A customer has a search cluster (SHC) of six members split evenly between two data centers (DC). The customer is concerned with network connectivity between the two DCs due to frequent outages. Which of the following is true as it relates to SHC resiliency when a network outage occurs between the two DCs?

- A. The SHC will function as expected as the SHC deployer will become the new captain until the network communication is restored.
- B. The SHC will stop all scheduled search activity within the SHC.
- C. The SHC will function as expected as the minimum required number of nodes for a SHC is 3.
- D. The SHC will function as expected as the SHC captain will fall back to previous active captain in the remaining site.

Correct Answer: D

QUESTION 5

What is the primary driver behind implementing indexer clustering in a customer's environment?

- A. To improve resiliency as the search load increases.
- B. To reduce indexing latency.
- C. To scale out a Splunk environment to offer higher performance capability.
- D. To provide higher availability for buckets of data.

Correct Answer: D
